## Assignment \#4

Write a program to that will convert a temperature in Celsius to Fahrenheit and vice-versa (declare your variable as double - this ensures you can calculate with decimal places).

- Use one textbox for inputting and output to one label.
- Round your answer to the nearest integer using the command: math.round(variable)
- Use labels as necessary to clarify the information on your form.
- Be sure to comment your code (I will be checking).
- When the Celsius button is pushed change the form background to blue and the button becomes disabled (the other button is enabled).
- When the Fahrenheit button is pushed change the form background to red and the button becomes disabled (the other button is enabled).
- Create a flowchart.
- The formulas for each are below:

$$
\begin{gathered}
C=\frac{5}{9}(F-32) \\
F=\frac{9}{5} C+32
\end{gathered}
$$
