

Can you see the solution??

$y = mx + b$
↑
slope
(5, 6)
↑
y-int.

There is
no
solution

Solution
 ∞ i.s

Internet Service

6.

NBtel charges a monthly fee of \$20.00, and an additional \$2.00 per hour.
 Sprint charges a monthly fee of \$10.00, and an additional \$4.00 per hour.

Equation??
 $m = \text{slope}$
 $b = y\text{-int.}$
 $20 = b$
 $h = 2$
 NBtel $y = 2x + 20$
 Sprint $y = 4x + 10$

$y = mx + b$

$m = 4$
 $b = 10$

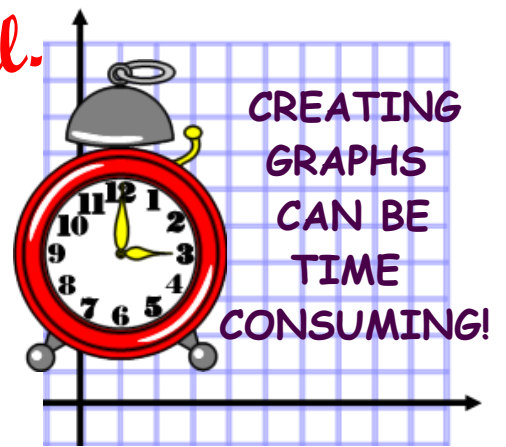

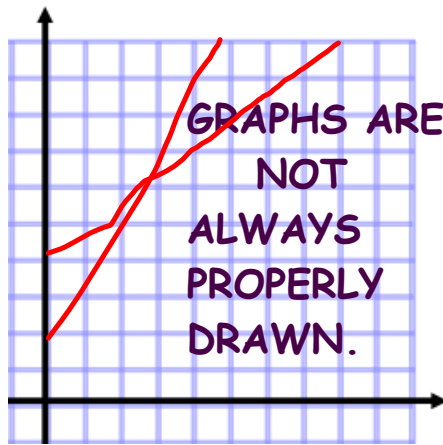

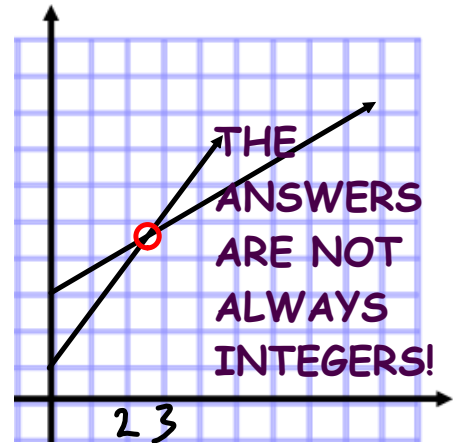

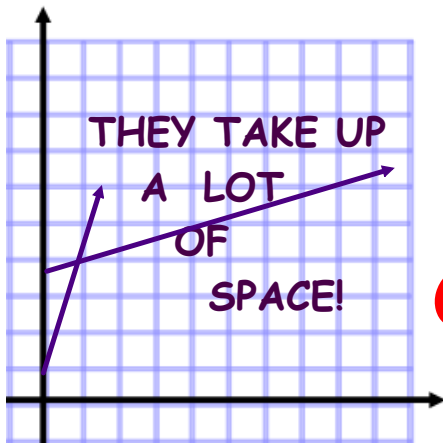

$y = \text{int.}$
 Slope = $\frac{\text{rise}}{\text{run}}$

\$

$m = \frac{\text{rise}}{\text{run}} = \frac{y}{x}$

Time

Graphing is not always practical.

Systems of Equations

Solve each system by graphing.

1) $y = -x - 3$ $m = -1$ $y\text{-int} = -3$
 $y = -7x + 3$ $m = -7$ $y\text{-int} = +3$

3) $y = \frac{2}{3}x + 4$ $m = \frac{2}{3}$ $y\text{-int} = 4$

4)

$y = mx + b$

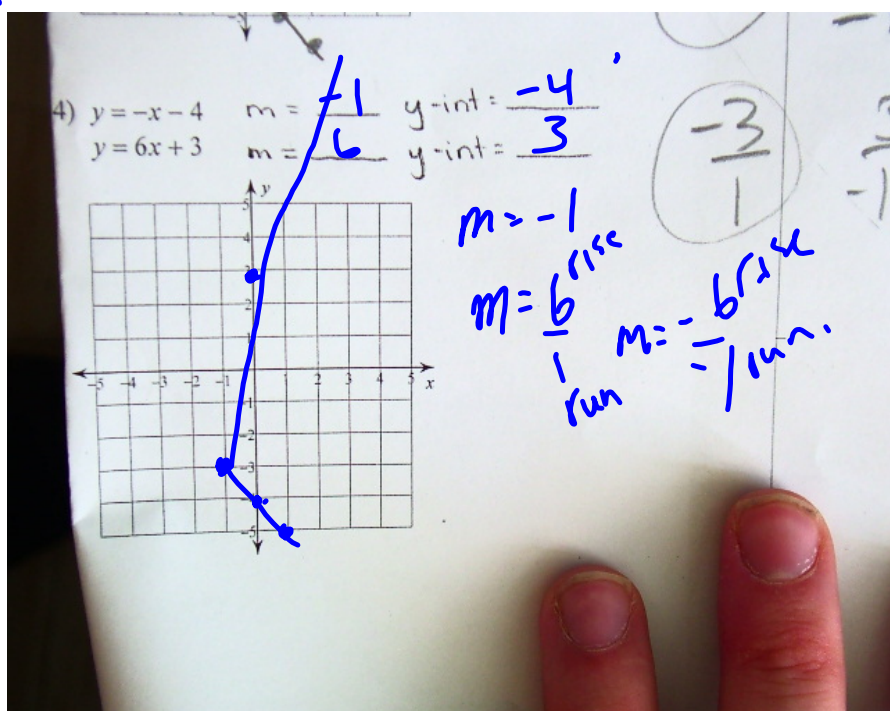

$m = \frac{\text{rise}}{\text{run}} = \frac{-1}{1}$ or $\frac{1}{-1}$

$m = \frac{\text{rise}}{\text{run}} = \frac{-7}{1}$ or $\frac{7}{-1}$

Solution \Rightarrow where two lines touch
 $(1, -4)$

$m = \frac{\text{rise}}{\text{run}}$

There are other ways to solve
Systems of Equations!

Elimination

Elimination is when you "eliminate" one of the variables.

Elimination by Addition

$$\begin{array}{r} y - 2x = 5 \\ -y - x = 4 \end{array}$$

Make sure the corresponding variables, constants and equal signs are lined up.

You must explain what you are doing.

Elimination by Addition

Consider the system

$$\begin{array}{l} x - 2y = 5 \quad \leftarrow \\ \text{☐} \\ 2x + 2y = 7 \quad \leftarrow \end{array}$$

Elimination by Addition

Consider the system

$$\begin{array}{r} x - 2y = 5 \\ + 2x + 2y = 7 \\ \hline \end{array}$$

← Lets add both equations
← to each other

Elimination by Addition

$$\begin{array}{r} x + 3y = 14 \\ -x + 4y = 7 \end{array}$$

Who would you eliminate??

Elimination by Addition

$$\begin{array}{r} x + 3y = 14 \\ -x + 4y = 7 \end{array}$$

Elimination By Subtraction

$$6x + 11y = -5$$

□

$$6x + 9y = -3$$

$$\begin{aligned}x - 2y &= -12 \\-2y - 6x &= 16\end{aligned}$$

$$-3x - 5y = 10$$

$$-3x - 7y = 14$$

Solve the following System of Equations

$$3x + y = 0$$

$$-x + y = 8$$

Make sure the corresponding variables,
constants and equal signs are lined up.

You must explain what you are doing.

Solve the following System of Equations

$$-2x + y = -7$$

$$-4x + 10y = -6$$

Make sure the corresponding variables,
constants and equal signs are lined up.

You must explain what you are doing.

Solve the following System of Equations

$$-2x + 8y = 2$$

$$3x - 3y = 15$$

Make sure the corresponding variables,
constants and equal signs are lined up.

You must explain what you are doing.

Try these:

1.

$$\begin{aligned}x - 2y &= 5 \\+ 2x + 2y &= 7\end{aligned}$$

2.

$$\begin{aligned}6x + 11y &= -5 \\6x + 9y &= -3\end{aligned}$$

3.

$$\begin{aligned}x + 2y &= 6 \\3x + 3y &= -6\end{aligned}$$

1.

$$\begin{array}{r} x - 2y = 5 \\ + 2x + 2y = 7 \\ \hline 3x \quad = 12 \end{array}$$

← Lets add both equations
← to each other

solve for x

ANS: (4, y)

$$x = 4$$

Now solve for y (HOW???)

- sub the value of x into one of the equations and solve for y

$$x - 2y = 5$$

$$4 - 2y = 5$$

$$- 2y = 1$$

$$y = \frac{-1}{2}$$

intersection point (4, - 0.5)

2.

Careful you are subtraction all of the second
(switch all signs on t second equation)

$$\begin{array}{r} 6x + 11y = -5 \\ -6x - 9y = +3 \\ \hline 2y = -2 \end{array}$$

$$y = -1$$

solve for x

$$\begin{aligned} 6x + 11y &= -5 \\ 6x + 11(-1) &= -5 \\ 6x - 11 &= -5 \\ 6x &= -5 + 11 \\ 6x &= 6 \\ x &= 1 \end{aligned}$$

Intersection (1, -1)

3.

Consider the system

$$\begin{array}{r} 3x + 6y = 18 \\ -3x - 3y = +6 \\ \hline 3y = 24 \end{array}$$

Now subtract the equations

$$y = 8$$

Sub into equation 1 (original) or the above

$$\begin{aligned} x + 2y &= 6 \\ x + 2(8) &= 6 \\ x + 16 &= 6 \\ x &= 6 - 16 \\ x &= -10 \end{aligned}$$

$$(-10, 6)$$
