## PRACTICE PROBLEMS

Ch. 9 Pg 390

1. What is the speed of sound in air at each of the following temperatures?
(a) $-15^{\circ} \mathrm{C}$
(b) $15^{\circ} \mathrm{C}$
(c) $25^{\circ} \mathrm{C}$
(d) $33^{\circ} \mathrm{C}$
2. For each speed of sound listed below, find the corresponding air temperature.
(a) $352 \mathrm{~m} / \mathrm{s}$
(b) $338 \mathrm{~m} / \mathrm{s}$
(c) $334 \mathrm{~m} / \mathrm{s}$
(d) $319 \mathrm{~m} / \mathrm{s}$
3. A ship's horn blasts through the fog. The sound of the echo from an iceberg is heard on the ship 3.8 s later.
(a) How far away is the iceberg if the temperature of the air is $-12^{\circ} \mathrm{C}$ ?
(b) How might weather conditions affect the accuracy of this answer?
4. An electronic fish-finder uses sound pulses to locate schools of fish by echolocation.

What would be the time delay between the emission of a sound pulse and the reception of the echo if a school of fish was located at a depth of 35 m in a lake? Assume the temperature of the water is $20^{\circ} \mathrm{C}$.
5. You want to estimate the length of a large sports complex. You generate a loud noise at one end of the stadium and hear an echo 1.2 s later. The air temperature is approximately $12^{\circ} \mathrm{C}$. How far away is the far wall of the stadium from your position?
6. (a) How long does it take for sound to travel 2.0 km in air at a temperature of $22^{\circ} \mathrm{C}$ ?
(b) The speed of light is $3.0 \times 10^{8} \mathrm{~m} / \mathrm{s}$. How long does it take for light to travel 2.0 km ?
(c) The rumble of thunder is heard 8.0 s after a flash of lightning hits a church steeple. The temperature is $22^{\circ} \mathrm{C}$. How far away is the church?

### 9.2 Section Review

1. C Provide a logical reason for the increase in the speed of sound in air with a rise in the temperature of the air.

## K/U Define Mach number.

3. C Given that the speed of any wave obeys the wave equation, $v=\lambda f$, and the speed of light is much greater than the speed of sound, comment on the values of wavelength and frequency for light compared to sound.
4. C An ambulance is not moving when it turns on its siren. As the ambulance starts
moving, you hear the pitch of the siren rise. How is the ambulance moving relative to you?
5. K/U What causes sonic boom?
6. MO Why do supersonic aircraft fly extremely high?

## Doppler Shift Problems

1. Calculate the observed frequency of a 6500 Hz source moving a) away from a stationary observer at $95 \mathrm{~m} / \mathrm{s}$ and b) towards a stationary observer. Take the speed of sound to be $325 \mathrm{~m} / \mathrm{s}$. $(9200 \mathrm{~Hz} ; 5200 \mathrm{~Hz})$
2. A fire truck emits a frequency of 7850 Hz and travels $22.4 \mathrm{~m} / \mathrm{s}$. An observer in a car is traveling at $17.4 \mathrm{~m} / \mathrm{s}$ on the same road. The speed of sound is $346 \mathrm{~m} / \mathrm{s}$. Calculate the frequency heard by the observer if the vehicles are a) approaching and b) receding. ( $8800 \mathrm{~Hz} ; 7000 \mathrm{~Hz}$ )
3. Calculate the speed of a truck if the driver hears a frequency of a police car to be 17700 Hz . The police car is driving $38.6 \mathrm{~m} / \mathrm{s}$ and its siren emits a frequency of 14000 Hz . The speed of sound is $334 \mathrm{~m} / \mathrm{s}$. $(39.4 \mathrm{~m} / \mathrm{s})$
4. A fighter plane is traveling at half the speed of sound and emits a frequency of 614 Hz . A passenger plane is traveling at one-fifth the speed of sound. Calculate the frequency detected by the passenger plane if they are a) approaching and b) receding. ( $1474 \mathrm{~Hz} ; 327 \mathrm{~Hz}$ )
5. A stationary observer at an air show watches a fighter plane approach at one-third the speed of sound. The plane emits a sound frequency of 315 Hz . Calculate the wavelength of the sound observed by the person. ( $\lambda=0.73 \mathrm{~m}$ )
6. What fraction of the speed of sound must a source be moving so that a stationary observer hears a frequency four times greater than the source? $\left(v=3 / 4 v_{s}\right)$
7. What fraction of the speed of sound must a source be moving so that a stationary observer hears a frequency twothirds that of the source? $\left(v=1 / 2 v_{s}\right)$

If the distances of the first and second charges, $q_{1}$ and $q_{2}$, from the point of zero potential are $d_{1}$ and $d_{2}$, then $d_{2}$ must satisfy $\mathrm{d}_{2}=\left(-\mathrm{q}_{2} / \mathrm{q}_{1}\right) \mathrm{d}_{1}$, with $\mathrm{q}_{2}>0$. For example, if $\mathrm{q}_{2}=-8.0 \mu \mathrm{C}$, then $\mathrm{d}_{2}=16 \mathrm{~cm}$ and the charge would be located either 24 cm to the right of $q_{1}$ or 8.0 cm to the left of $\mathrm{q}_{1}$.
