

# Significant Figures

## Rules for Counting Sig. Fig.

1. All non-zero digits are significant

53 (2)

2. Zeroes

a) zeroes between non-zero digits are significant

Ex. 507 (3)      50007 (5)

b) leading zeroes are not significant

Ex. 0.00004 (1)      0.005504 (4)

c) Trailing zeroes to the right of a number are significant if **the number has a decimal point**. If the number ends in zero and has no decimal point, we assume that the trailing zeroes are not significant.

Ex. 480.0 (4 sig figs)

Ex. 4800 (2 sig figs)

4800.

How many significant figures in the following?

a) 38.4703 mL - 6 sig. figs

b) 0.0052 g - 2 sig. figs

c) 0.05700 s - 4 sig. figs

d)  $6.19 \times 10^8$  years - 3 sig. figs

## Significant Figures and Calculations

### 1. Multiplication and Division

The result of the operation is reported as having **as many significant figures as the measurement with the fewest significant figures.**

$$\text{Ex. } (6.221 \text{ cm}) \times (5.2 \text{ cm}) = 32 \text{ cm}^2$$

4                      2

✓  
32.3492

### 2. Addition and Subtraction

The result of the operation is reported to the **same number of decimal places as that of the term with the least number of decimal places.**

Ex. 20.4

$$\begin{array}{r} 20.4 \\ + 1.322 \\ + 83 \\ \hline 105 \end{array}$$

104.722

# Measuring Matter

All forms of matter are normally measured by count, mass or volume.

**Mole (mol)** - SI unit for measuring the amount of a substance  
A mole of any substance contains  $6.02 \times 10^{23}$  representative particles.

$6.02 \times 10^{23}$  is referred to as **Avagadro's number**

Representative particles refers to the species present in a substance, usually atoms, molecules or formula units.

**Fe**

**O<sub>2</sub>**

**NaCl**

Ex. one mole of atoms =  $6.02 \times 10^{23}$  atoms  
one mole of molecules =  $6.02 \times 10^{23}$  molecules

## Converting Number of Particles to Moles

$$\text{moles} = \text{representative particles} \times \frac{1 \text{ mole}}{6.02 \times 10^{23} \text{ representative particles}}$$

Ex. How many moles are found in  $1.60 \times 10^{18}$  atoms of silicon?

$$1.60 \times 10^{18} \text{ atoms Si} \times \frac{1 \text{ mol Si}}{6.02 \times 10^{23} \text{ atoms Si}} = 2.66 \times 10^{-6} \text{ mol Si}$$
