Differentiation Rules

I. Constant Functions

• Sketch the function y = 2

The derivative of a constant will always be equal to "0".

Formal Proof:

$$f'(x) = \lim_{h \to 0} \frac{f(x+h) - f(x)}{h} = \lim_{h \to 0} \frac{c - c}{h}$$
$$= \lim_{h \to 0} 0 = 0$$

II. Power Functions

We want to come up with a rule to differentiate functions of the form $f(x) = x^n$, $x \in R$

Here are a couple derivatives that we would have already looked at using limits:

$$\frac{d}{dx}(x^2) = 2x \qquad \frac{d}{dx}(x^3) = 3x^2$$

Using the definition of a derivative to differentiate $f(x) = x^4$ would lead to ...

$$f'(x) = \lim_{h \to 0} \frac{f(x+h) - f(x)}{h} = \lim_{h \to 0} \frac{(x+h)^4 - x^4}{h}$$

$$= \lim_{h \to 0} \frac{x^4 + 4x^3h + 6x^2h^2 + 4xh^3 + h^4 - x^4}{h}$$

$$= \lim_{h \to 0} \frac{4x^3h + 6x^2h^2 + 4xh^3 + h^4}{h}$$

$$= \lim_{h \to 0} (4x^3 + 6x^2h + 4xh^2 + h^3) = 4x^3$$

Do you see a pattern emerging?

Uncover the POWER RULE

The Power Rule (General Version) If n is any real number, then

$$\frac{d}{dx}\left(x^{n}\right) = nx^{n-1}$$

Let's practice using the power rule...

Differentiate each of the following functions:

1.
$$f(x) = x^{25}$$

3.
$$f(x) = \frac{1}{x^{10}}$$

 $f(x) = x^{-10}$
 $f'(x) = -10x^{-11}$
 $f'(x) = -\frac{10}{x''}$

2.
$$f(x) = x^{-5}$$

 $F'(x) = -5x^{-6}$
 $F'(x) = \frac{-5}{x^{6}}$
4. $f(x) = \sqrt[5]{x^{7}}$
 $f(x) = x^{7/5}$
 $F'(x) = \frac{7}{x^{9/5}}$

f'(x) = 1 1 x 3

Constant Multiples

The following formula says that the derivative of a constant multiplied by a function is the constant multiplied by the derivative of the function:

$$\frac{d}{dx}\left[cf(x)\right] = c\frac{d}{dx}f(x)$$

EXAMPLE 4

(a)
$$\frac{d}{dx}(3x^4) = 3\frac{d}{dx}(x^4) = 3(4x^3) = 12x^3$$

(b)
$$\frac{d}{dx}(-x) = \frac{d}{dx}[(-1)x] = (-1)\frac{d}{dx}(x) = -1(1) = -1$$

Examples:

1.
$$f(x) = 4x^3$$

$$f'(x) = 1/2x^3$$

3.
$$f(x) = 5x^{\frac{6}{5}}$$

2.
$$f(x) = \frac{8}{x^2}$$

$$f'(x) = -16x^{-3}$$

$$f'(x) = -\frac{16}{x^3}$$

4.
$$f(x) = (3x^2)^2$$

$$F'(x) = 36x^3$$

Sums and Differences

These next rules say that the derivative of a sum (difference) of functions is the sum (difference) of the derivatives:

The Sum Rule If f and g are both differentiable, then

$$\frac{d}{dx}[f(x) + g(x)] = \frac{d}{dx}f(x) + \frac{d}{dx}g(x)$$

The Difference Rule If f and g are both differentiable, then

$$\frac{d}{dx}[f(x) - g(x)] = \frac{d}{dx}f(x) - \frac{d}{dx}g(x)$$

Demonstrate what this all means...

Differentiate each of the following:

1.
$$f(x) = 2x^4 + \sqrt{x}$$

$$f(x) = \partial_x^4 + x^4$$

$$f'(x) = 8x^3 + \frac{1}{2}x^{-1/3} = 8x^3 + \frac{1}{2}x^{-1/3}$$

2.
$$f(x) = 6x^4 - 5x^3 - 2x + 17$$

 $f'(x) = 34x^3 - 15x^3 - 3$

3.
$$f(x) = (2x^3 - 5)^2$$

 $F(x) = 4x^6 - 30x^3 + 35$
 $F'(x) = 34x^5 - 60x^3$

Recall the derivative of a function is equal to the slope of a line that is tangent to the function.

Find the slope of the tangent line to the function at the given "x" coordinate!

$$f(x) = 3x^2$$
 at $x = 4$
 $f'(x) = 6x$

$$f'(x) = 6x$$

$$f'(x) = 6x$$

$$f'(y) = 6(4)$$

Example:

Find the equation of the tangent line to the curve $f(x) = x^6$ at the point (-2, 64)

Remember that the equation of a line is found by using the point-slope formula... $y - y_1 = m(x - x_1)$

The curve is the graph of the function $f(x) = x^6$ and we know that the slope of the tangent line at (-2, 64) is the derivative f'(-2)

- Find derivative
- Fill in x value and solve for slope
- Use equation of a line formula and solve

$$F(x) = x^{6} \qquad F'(3) = 6(-3)^{5} \qquad y-y_{1} = m(x-x_{1})$$

$$F'(x) = 6x^{5} \qquad = 6(-3)^{3} \qquad y-64 = -190(x+3)$$

$$= -190 \qquad y-64 = -190x-384$$

$$= -190 \qquad y-64 = -190x-384$$
