

Polynomials

A *polynomial* is one term or the sum of terms whose variables have whole-number exponents.

Polynomials

Just like there are many different types of chairs, there are many different types of polynomials.

Monomials...

Monomials are polynomials with ONE term.

14

Example

X

Example

$11y^2$

"Terms are numbers, variables,
or the
product of numbers and variables

Jay Leno's
monologue

Binomials...

Binomials are polynomials with TWO terms.

$$7x+3$$

Example

$$12y-x$$

Example

$$13x^2+x$$

Example

Terms are separated by + and - signs!

Trinomials...

Trinomials are polynomials with THREE terms.

$$-6x + 7y - 2$$

Example

$$7x^2 + 8x + 7$$

Example

$$8 + 5m - 7m^2$$

Example

Monomial

$8b+2$ $6x$
 71

Binomial

$10x-5w$

Trinomial

$6x^2-5x+8$
 $7y+9z-q$

Sort the following polynomials into the above categories:

The coefficient of the variable... $15x$... is 15.

The coefficient is the number in front of the variable.

Degree of a Polynomial

The term with the greatest exponent determines the degree of the polynomial.

$$5x - 3x^2 + 7$$

This polynomial has a degree of 2.

$$5x^3 + 7x^8 - 3x + 3x^2 + 9$$

This polynomial has a degree of 8, because the largest exponent is 8.

The term "+9" has a degree of 0, because there is no variable with it. It is called a "constant", because this term will never change in value.

Polynomials are written in descending order.

Each term is written
from the highest degree
to the lowest.

$$5x^3 - 3x^4 - x + 7 + 4x^2$$

will be written as...

$$-3x^4 + 5x^3 + 4x^2 - x + 7$$

Modelling Polynomials

$$3x+4$$

$$2x^2-4x+2$$

Modelling Polynomials

Write the algebraic expression that represents each model.

Don't forget to write it properly!
