

# System of Equations

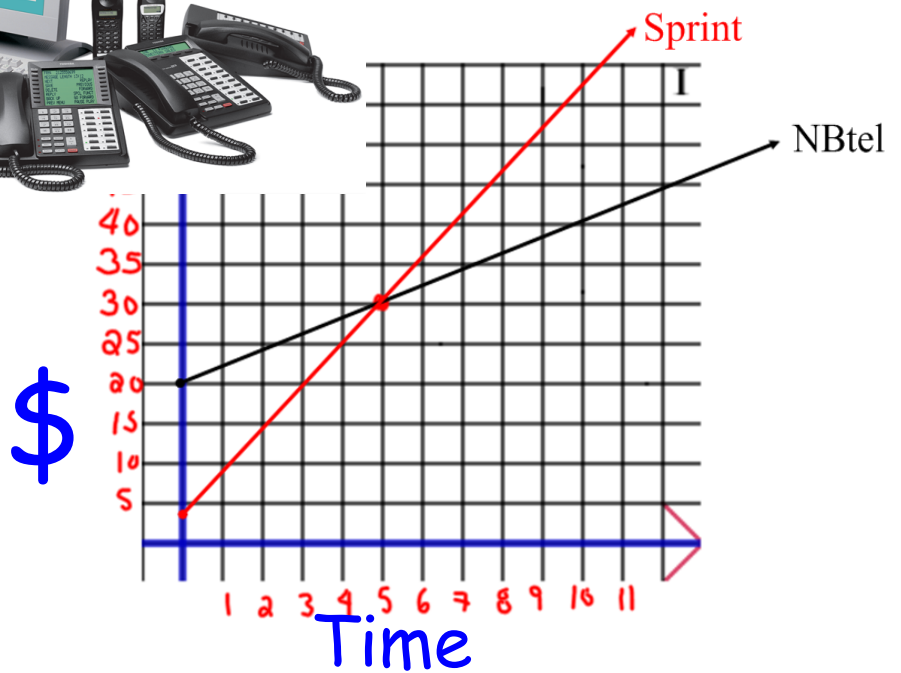

### Internet Service

NBtel charges a monthly fee of \$20.00, and an additional \$2.00 per hour.  
Sprint charges a monthly fee of \$10.00, and an additional \$4.00 per hour.

Equation??

NBtel \_\_\_\_\_  
Sprint \_\_\_\_\_

*Graphing  
is not  
always  
practical.*

There are other ways to solve  
Systems of Equations!

# Elimination

Elimination is when you "eliminate" one of the variables.

# Elimination by Addition

$$\begin{array}{r} y - 2x = 5 \quad \textcircled{1} \\ -y - 1x = 4 \quad \textcircled{2} \\ \hline \end{array}$$

$\textcircled{1} + \textcircled{2}$

$$\begin{array}{r} -3x = 9 \\ \underline{-3} \quad \underline{-3} \end{array}$$

$$x = -3$$

Sub in  $\textcircled{1}$

$$y - 2x = 5$$

$$y - 2(-3) = 5$$

$$y + 6 = 5 - 6$$

$$y = -1$$

Make sure the corresponding variables, constants and equal signs are lined up.

You must explain what you are doing.

$$(-3, -1)$$

# Elimination by Addition

Consider the system

$$x - 2y = 5 \quad \leftarrow$$

$$\begin{matrix} \square \\ 2x + 2y = 7 \end{matrix} \quad \leftarrow$$

# Elimination by Addition

Consider the system

$$\begin{array}{r} 1x - 2y = 5 \text{ ①} \\ + 2x + 2y = 7 \text{ ②} \end{array}$$

Lets add both equations to each other

$$\begin{array}{l} \text{①} + \text{②} \\ \hline \frac{3x}{3} = \frac{12}{3} \\ \hline x = 4 \end{array}$$

Sub in ①

$$\begin{array}{l} x - 2y = 5 \\ \text{④} - 2y = 5 - 4 \\ \hline -2y = 1 \\ \hline y = -\frac{1}{2} \end{array}$$

$(4, -\frac{1}{2})$

## Elimination by Addition

$$\begin{array}{r} x + 3y = 14 \quad \textcircled{1} \\ -x + 4y = 7 \quad \textcircled{2} \\ \hline \end{array}$$

Who would you eliminate??

$$\begin{array}{r} \textcircled{1} + \textcircled{2} \quad \cancel{7}y = \cancel{7}y + 21 \\ \hline y = 3 \end{array}$$

$(5, 3)$

Sub in  $\textcircled{1}$

$$\begin{array}{r} x + 3y = 14 \\ x + 3(3) = 14 \\ x + \textcircled{9} = 14 - 9 \\ x = 5 \end{array}$$

# Elimination by Addition

$$\begin{array}{r} x + 3y = 14 \\ -x + 4y = 7 \end{array}$$

## Elimination By Subtraction

$$6x + 11y = -5 \quad \textcircled{1}$$

$$\begin{array}{r} \square \\ -6x + 9y = +3 \quad \textcircled{2} \end{array} \quad \text{Add the Opposite}$$

---

$$\textcircled{1} + \textcircled{2} \quad \frac{2y}{2} = \frac{-2}{2}$$

---

$$y = -1$$

$$(1, -1)$$

Sub in  $\textcircled{1}$

$$6x + 11y = -5$$

$$6x + 11(-1) = -5$$

$$6x - 11 = -5 + 11$$

$$\frac{6x}{6} = \frac{6}{6}$$

$$x = 1$$

$$\begin{aligned}x - 2y &= -12 \\-2y - 6x &= 16\end{aligned}$$

$$-3x - 5y = 10 \quad (1)$$

$$+3x + 7y = -14 \quad (2)$$

Add the Opp.

(1)+(2)

$$\frac{2y}{2} = \frac{-4}{2}$$

$$y = -2$$

(0, -2)

Sub in (1)

$$-3x - 5y = 10$$

$$-3x - 5(-2) = 10$$

$$-3x + 10 = 10 - 10$$

$$\frac{-3x}{-3} = \frac{0}{-3} \quad x = 0$$

## Solve the following System of Equations

$$\begin{array}{r} \cancel{x + 2y = 7} \quad \textcircled{1} \\ -2x + 8y = 10 \quad \textcircled{2} \\ \hline \end{array}$$

Make sure the corresponding variables, constants and equal signs are lined up.

$$\begin{array}{r} \textcircled{1} \times 2 \quad 2x + 4y = 14 \quad \textcircled{3} \\ -2x + 8y = 10 \quad \textcircled{2} \\ \hline \end{array}$$

$$\begin{array}{r} \textcircled{3} + \textcircled{2} \\ \frac{12y}{12} = \frac{24}{12} \\ \hline y = 2 \end{array}$$

You must explain what you are doing.

$$\begin{array}{r} \text{Sub in } \textcircled{1} \\ x + 2y = 7 \\ x + 2(2) = 7 \\ x + 4 = 7 - 4 \\ \hline x = 3 \end{array}$$

$(3, 2)$

## Solve the following System of Equations

$$-5x - 9y = 27 \quad \textcircled{1}$$

$$4x + 3y = -9 \quad \textcircled{2}$$

Make sure the corresponding variables, constants and equal signs are lined up.

$$\textcircled{2} \times 3$$

$$12x + 9y = -27 \quad \textcircled{3}$$

$$-5x - 9y = 27 \quad \textcircled{1}$$

$$\textcircled{3} + \textcircled{1}$$

$$\frac{7x}{7} = \frac{0}{7}$$

$$x = 0$$

You must explain what you are doing.

Sub in  $\textcircled{2}$

$$4x + 3y = -9$$

$$4(0) + 3y = -9$$

$$\frac{3y}{3} = \frac{-9}{3}$$

$$y = -3$$

$$(0, -3)$$

## Solve the following System of Equations

$$\underline{3x + 2y = 12} \quad (1)$$

$$\underline{2x + 3y = 13} \quad (2)$$

$$(1) \times 2 \quad \underline{6x + 4y = 24} \quad (3)$$

$$(2) \times -3 \quad \underline{-6x - 9y = -39} \quad (4)$$

$$(3) + (4) \quad \underline{\underline{-5y = -15}}$$

$$\underline{\underline{y = 3}}$$

Sub in (2)

$$2x + 3y = 13$$

$$2x + 3(3) = 13$$

$$2x + 9 = 13 - 9$$

$$\underline{\underline{2x = 4}}$$

$$\underline{\underline{x = 2}}$$

Make sure the corresponding variables, constants and equal signs are lined up.

You must explain what you are doing.

(2, 3)

Try these:

1.

$$\begin{aligned}x - 2y &= 5 \\+ 2x + 2y &= 7\end{aligned}$$

2.

$$\begin{aligned}6x + 11y &= -5 \\6x + 9y &= -3\end{aligned}$$

3.

$$\begin{aligned}x + 2y &= 6 \\3x + 3y &= -6\end{aligned}$$

1.

$$\begin{array}{r} x - 2y = 5 \\ + 2x + 2y = 7 \\ \hline 3x \quad = 12 \end{array}$$

← Lets add both equations to each other

solve for x

ANS: (4, y)

$$x = 4$$

Now solve for y (HOW???)

- sub the value of x into one of the equations and solve for y

$$x - 2y = 5$$

$$4 - 2y = 5$$

$$- 2y = 1$$

$$y = \frac{-1}{2}$$

intersection point (4, - 0.5)

2.

Careful you are subtraction all of the second  
(switch all signs on t second equation)

$$\begin{array}{r} 6x + 11y = -5 \\ -6x - 9y = +3 \\ \hline 2y = -2 \end{array}$$

$$y = -1$$

solve for x

$$\begin{aligned} 6x + 11y &= -5 \\ 6x + 11(-1) &= -5 \\ 6x - 11 &= -5 \\ 6x &= -5 + 11 \\ 6x &= 6 \\ x &= 1 \end{aligned}$$

Intersection (1, -1)

3.

Consider the system

$$\begin{array}{r} 3x + 6y = 18 \\ -3x - 3y = +6 \\ \hline 3y = 24 \end{array}$$

Now subtract the equations

$$y = 8$$

Sub into equation 1 (original) or the above

$$\begin{aligned} x + 2y &= 6 \\ x + 2(8) &= 6 \\ x + 16 &= 6 \\ x &= 6 - 16 \\ x &= -10 \end{aligned}$$

$$(-10, 6)$$
