

## FINDING ARC LENGTH

STEP 1 – Calculate the *CIRCUMFERENCE* using:

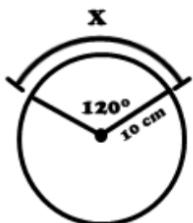

$$C = 2\pi r$$

STEP 2 – Find *ARC LENGTH* using:

$$\frac{\text{Length of Arc}}{\text{Circumference}} = \frac{\text{Angle}}{360^\circ}$$

## EXAMPLE PROBLEM

Step 1) Calculate Circumference

$$C = 2\pi r$$

$$\begin{aligned} &= 2\pi(10\text{cm}) \\ &= 2(3.14)(10\text{cm}) \end{aligned}$$

$$\text{Circumference} = 62.8 \text{ cm}$$

Step 2) Use the ratio

$$\frac{\text{Length of Arc}}{\text{Circumference}} = \frac{\text{Angle}}{360^\circ}$$

$$\frac{x}{62.8 \text{ cm}} = \frac{120^\circ}{360^\circ}$$

Cross multiply and solve for "x"

$$360^\circ x = (120^\circ)(62.8\text{cm})$$

$$360x = 7536^\circ \text{cm}$$

$$\frac{360^\circ x}{360^\circ} = \frac{7536^\circ \text{cm}}{360^\circ}$$

$$x = 20.9 \text{ cm}$$
