# Naming and Writing Formulas for Acids

## Reminder:

**Acids are aqueous hydrogen compounds that turn blue litmus red.**

**Bases are aqueous solutions of ionic hydroxides that turn red litmus blue.**

## IDENTIFYING ACIDS FROM FORMULAS FROM FORMULA'S

Most acid can be identified from **starting with H** or ending in **COOH**.

i.e.  $\text{HCl}$ ,  $\text{H}_2\text{SO}_4$ ,  $\text{CH}_3\text{COOH}$

**Note:  $\text{NH}_3$  and  $\text{CH}_4$  are not acids!**

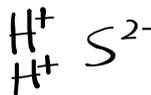

When naming acids, common names (for common acids) or IUPAC names can be used.

## IUPAC (modern) Acid Names

- name the acid as an aqueous hydrogen compound

Ex. aqueous hydrogen sulfide -  $\text{H}_2\text{S}_{(\text{aq})}$

~~~~~

## Classical Acid Names

- used the suffix **-ic** Ex. sulfuric

- used hydro and the suffix **-ic** Ex. hydrochloric

- used suffix **-ous** Ex. sulfurous

- and others (see inside back cover)

## IONIC

## MOLECULAR

Carbon dioxide

## BASES

sodium hydroxide

## Rules for Naming Acids

(Classical)

1. If anion ends in -ide, the acid is "hydrochloric acid"

Ex. HCl

aqueous hydrogen chloride

2. If anion ends in -ate, the acid is "Sulfuric acid"

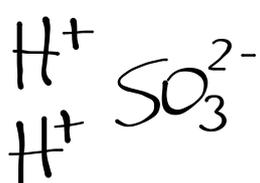

Ex. H<sub>2</sub>SO<sub>4</sub>

aqueous hydrogen sulfate

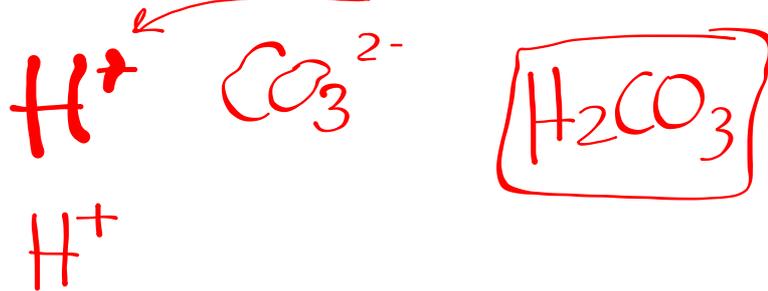

3. If anion ends in -ite, the acid is "Sulfurous acid"

Ex. H<sub>2</sub>SO<sub>3</sub>

aqueous hydrogen sulfite

Carbonic acid

aqueous hydrogen acetate

acetic acid

p. 271-273
