Limits at Infinity

What exactly is infinity?

• It is the *process* of making a value arbitrarily large or small

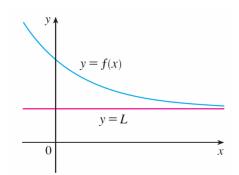

+ ∞ Positive Infinity...process of becoming arbitrarily large

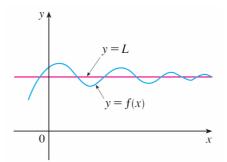

— **∞** — Negative Infinity...process of becoming arbitrarily small

4 Definition Let f be a function defined on some interval (a, ∞) . Then

$$\lim_{x \to \infty} f(x) = L$$

means that the values of f(x) can be made as close to L as we like by taking x sufficiently large.

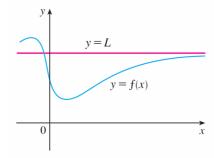

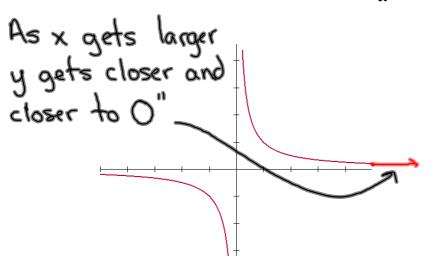

FIGURE 9

Examples illustrating $\lim f(x) = L$

Have a look at these limits...

$$\lim_{x\to\infty}\frac{1}{x}=0$$

$$\lim_{x\to\infty}\frac{1}{x}=0$$

In general...

If n is a positive integer, then

$$\lim_{x\to\infty}\frac{1}{x^n}=0$$

$$\lim_{x \to \infty} \frac{1}{x^n} = 0 \qquad \qquad \lim_{x \to -\infty} \frac{1}{x^n} = 0$$

Calculating limits at infinity without using a graph

Rational Functions

Note: If every term in a rational expression is divided by the same value, the rational expression will still be equal to it's original value

$$\frac{12+8}{6-2} = \frac{20}{4} = \frac{5}{4} = \frac{10}{4} = \frac{5}{4} = \frac{10}{3} = \frac{5}{4}$$
Divide the numerator and denominator by 2

This will be important when evaluating limits for rational functions approaching infinity...

Look at the following example:

$$\lim_{x \to \infty} \frac{3x^2 - x - 2}{5x^2 + 4x + 1} = \lim_{x \to \infty} \frac{\frac{3x^2 - x - 2}{x^2}}{\frac{5x^2 + 4x + 1}{x^2}} = \lim_{x \to \infty} \frac{3 - \frac{1}{x} - \frac{2}{x^2}}{5 + \frac{4}{x} + \frac{1}{x^2}}$$

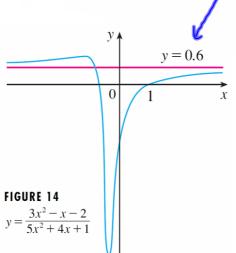

$$=\frac{3-0-0}{5+0+0}$$

$$=\frac{3}{5}$$

= 0.6

 $\lim_{x \to \infty} \frac{3x^2 - x - 2}{5x^2 + 4x + 1} = \lim_{x \to \infty} \frac{3x^2 - x - 2}{\frac{5x^2 + 4x + 1}{x^2}} = \lim_{x \to \infty} \frac{3 - \frac{1}{x} - \frac{2}{x^2}}{5 + \frac{4}{x} + \frac{1}{x^2}}$ The provided every term by the HIGHEST power that is present in either the numerator or denominator of the rational expression once they are expanded $= \frac{3 - 0 - 0}{5 + 0 + 0}$ The degree of the numerator with the degree of the degree of the degree of the numerator with the degree of the d

This graph below validates our solution:

Calculating limits at infinity without using a graph

- Remember
- If the highest degree is in the denominator then the Limit will be equal to 0
- If the highest degree is in the numerator then the Limit will not exist.
- a If the degree is the same in the numerator and denominator then the *Limit* will be equal to the coefficients in front of the highest degree.

Evaluate the following limit:

$$\lim_{n\to\infty}\frac{n^2-n}{2n^2+1} = \frac{1}{3}$$

$$\lim_{n\to\infty}\frac{1-n^5}{1+2n^5} = \frac{1}{3}$$

$$\lim_{n\to\infty} \frac{4n}{1} = DNE$$

$$\lim_{x \to \infty} \frac{-3(x^2 - 4)^2}{3 - 5x^2}$$

$$l_{1m} - 3(x^{4} - 8x^{3} + 16)$$

 $x \to \infty$ 3-5x³

or
$$l_{im} = \frac{3x^4 + 34x^3 - 48}{3 - 5x^3} = DNE$$
