

⑦  $d = 200 \text{ km}$        $10 \text{ m/s} \times \frac{3.6 \text{ km/h}}{1 \text{ m/s}} = 36 \text{ km/h}$   
 $v = 10 \text{ m/s}$

$t = ?$

$t = \frac{d}{v}$

$t = \frac{200 \text{ km}}{36 \text{ km/h}}$

$t = 5.6 \text{ h}$

⑧ Car

$v = \frac{d}{t}$

$v = \frac{240 \text{ km}}{2.0 \text{ h}}$

$v = 120 \text{ km/h}$

Sprinter

$v = \frac{d}{t}$

$v = \frac{100 \text{ km}}{9.5 \text{ s}}$

$v = 10.5 \text{ m/s}$

$\frac{37.8 \text{ km/h}}{10.5 \text{ m/s} \times \frac{3.6 \text{ km/h}}{1 \text{ m/s}}}$   
 $82.2 \text{ km/h}$

$= 37.8 \text{ km/h}$

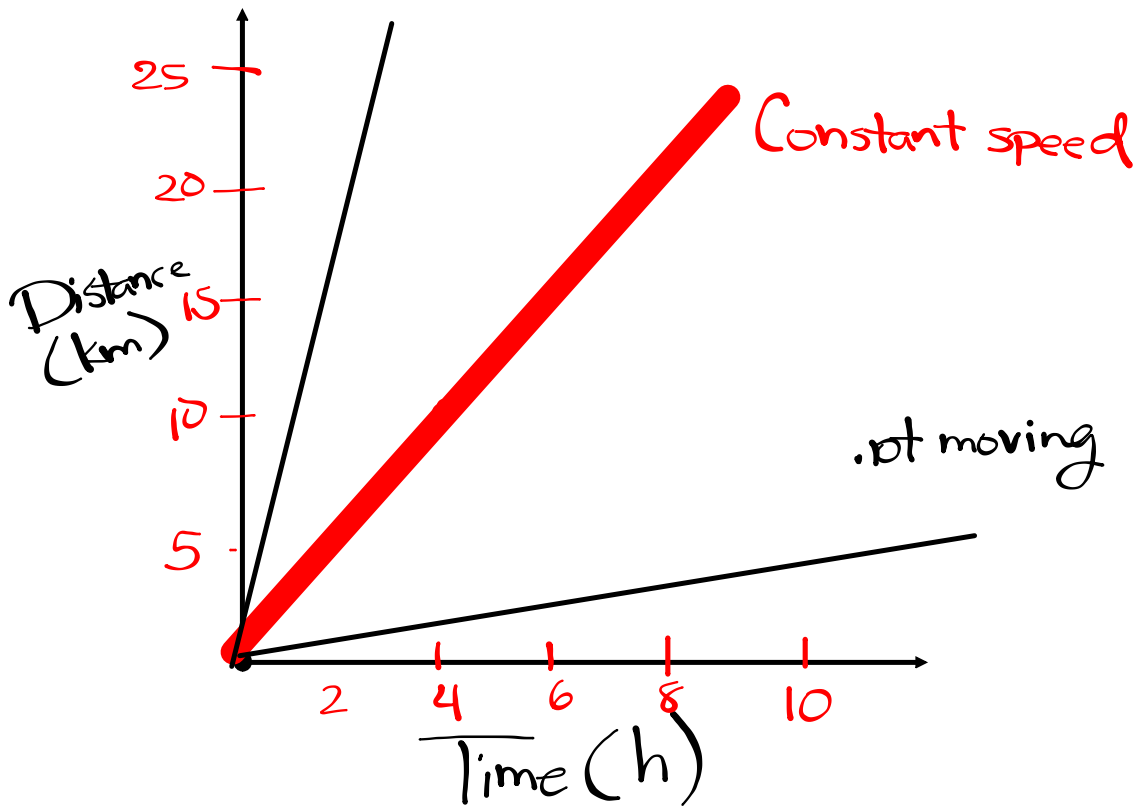

# Distance- Time Graphs

Shows the relationship between distance and time.

Distance is plotted on the y-axis and is the dependent variable

Time is plotted on the x-axis and is the independent variable

# Distance-time graphs

SMART  
Technologies

Label the graph.

answer

distance

time

moving

stationary

## Constant Speed

If an object has a constant speed, it shows as a straight line on a distance-time graph.

The slope of a line on a distance time graph represents the speed.

If you increase the speed the slope will become steeper.

a-b = bike

a-c = run

a-d = walk

Based on the following graph which is the fastest way to travel?

## Calculating Speed

To calculate the actual speed on a distance time graph you calculate the slope using two points on the graph and the following formula:

$$v = \frac{\Delta d}{\Delta t} = \frac{y_2 - y_1}{x_2 - x_1}$$

$$\begin{array}{cccc} (6, 4) & ; & (15, 10) & \\ \uparrow & \uparrow & \uparrow & \uparrow \\ x_1 & y_1 & x_2 & y_2 \end{array} \quad \text{distance (m)}$$

$$v = \frac{10\text{m} - 4\text{m}}{15\text{s} - 6\text{s}}$$

$$v = \frac{6\text{m}}{9\text{s}}$$

$$v = 0.67\text{m/s}$$

Answer the questions in your exercise books.

1. What is the average speed between **a** and **b**?
2. Which line shows the vehicle is stationary?
3. Which line shows the greatest speed?

answer

## Calculating Speed

To calculate the actual speed on a distance time graph you calculate the slope using two points on the graph and the following formula:

$$v = \frac{\Delta d}{\Delta t} = \frac{y_2 - y_1}{x_2 - x_1}$$

$$\text{i.e. } v = \frac{10\text{m} - 4\text{m}}{15\text{s} - 6\text{s}}$$

$$v = \frac{6\text{m}}{9\text{s}}$$

$$v = 0.6\text{m/s}$$

distance (m)

Answer the questions in your exercise books.

1. What is the average speed between a and b?  $2.1\text{m/s}$
2. Which line shows the vehicle is stationary?  $bc$
3. Which line shows the greatest speed?  $cd$
