

Units 1-2

- Types of matter
- Isotopes
- Ions
- Quantum Mechanical Model
- Electron configurations
- Naming Ionic Compounds
- Naming Molecular Compounds
- Empirical and Theoretical Properties of Acids/Bases

Isotope Name	Atomic Number	Mass Number	Symbol	# of Protons	# of Neutrons
<u>carbon-13</u>	6	13	¹³ ₆ C	6	7
			⁵⁶ Fe		
				9	11
	15	33			

2.01

Name	Symbol	Protons	Electrons
calcium ion	Ca^{2+}	20	18
fluoride ion			
		29	28
sulfide ion	S^{2-}	16	18

Binary Ionic Compounds - Type I

calcium chloride

sodium oxide

Binary Ionic Compounds - Type II

iron(III) chloride

copper (II) sulfide

Binary Ionic Compounds - Polyatomic

lithium nitrate

sodium sulfate

Ionic Hydrates

Calcium nitrate - 3 water
" " trihydrate

Molecular Compounds

dinitrogen pentoxide

Quantum Mechanical Model of an Atom

The quantum mechanical model determines the allowed energies an electron can have and how likely it is to find the electron in various locations around the nucleus.

atomic orbital - region of space in which there is a high probability to find an electron

Principal quantum numbers (n) represent energy levels of electrons (i.e., $n = 1, 2, 3, 4$, etc.)

There may be several orbitals with different shapes at different energy levels.

s orbital

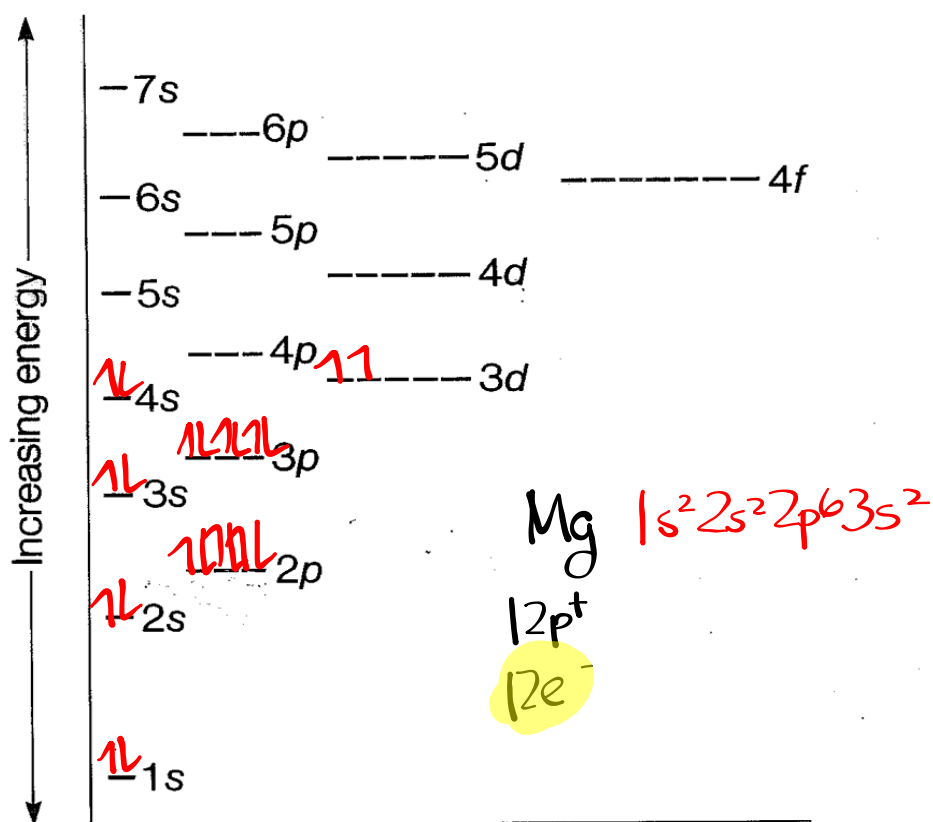

p orbitals

d orbitals

Aufbau Diagram

Aufbau principle - electrons occupy orbitals of lowest energy first

Pauli exclusion principle- an atomic orbital can describe at most two electrons

Hund's rule - one electron enters each orbital until all orbitals contain one electron with the same spin
