

Warm Up

Solid carbon dioxide, at a temperature of $-98.0\text{ }^{\circ}\text{C}$ is heated until it becomes a gas at its boiling point ($-56.0\text{ }^{\circ}\text{C}$). Draw the heating curve. The melting point is $-78.5\text{ }^{\circ}\text{C}$.

20.0 g of steam at 115°C is cooled until it becomes ice at 0.0°C. Calculate the energy change for the system.

$$\Delta E_T = q_g + \Delta H_{\text{cond}} + q_e + \Delta H_{\text{solid}}$$

$$q_g = mC\Delta T$$

$$q_g = (20.0 \text{ g}) \left(2.01 \frac{\text{J}}{\text{g} \cdot ^\circ\text{C}} \right) (-15^\circ\text{C})$$

$$q_g = -603 \text{ J}$$

$$\Delta H_{\text{cond}} = nH_{\text{cond}}$$

$$\Delta H_{\text{cond}} = \left(\frac{20.0 \text{ g}}{18.02 \text{ g/mol}} \right) \left(-40.8 \frac{\text{kJ}}{\text{mol}} \right)$$

$$\Delta H_{\text{cond}} = -45.283 \text{ kJ}$$

$$q_e = mC\Delta T$$

$$q_e = (20.0 \text{ g}) \left(4.19 \frac{\text{J}}{\text{g} \cdot ^\circ\text{C}} \right) (-100.^\circ\text{C})$$

$$q_e = -8380 \text{ J}$$

$$\Delta H_{\text{solid}} = nH_{\text{solid}}$$

$$\Delta H_{\text{solid}} = \left(\frac{20.0 \text{ g}}{18.02 \text{ g/mol}} \right) \left(-6.03 \frac{\text{kJ}}{\text{mol}} \right)$$

$$\Delta H_{\text{solid}} = -6.693 \text{ kJ}$$

$$\Delta E_T = (-0.603 \text{ kJ}) + (-45.283 \text{ kJ}) + (-8.380 \text{ kJ}) + (-6.693 \text{ kJ})$$

$$\Delta E_T = -66.4 \text{ kJ}$$
