Introduction to Trigonometric Equations

trigonometric equation

- an equation involving trigonometric ratios

Focus on...

- algebraically solving first-degree and second-degree trigonometric equations in radians and in degrees
- verifying that a specific value is a solution to a trigonometric equation
- identifying exact and approximate solutions of a trigonometric equation in a restricted domain
- determining the general solution of a trigonometric equation

Did You Know?

In equations, mathematicians often use the notation $\cos^2 \theta$. This means the same as $(\cos \theta)^2$.

Let's start with basic LINEAR trigonometric equations...

...Pre-Calculus 110

Solve: $\sin\theta = 0.9659\ ,\ -360° < \theta < 720°$ (Degrees)

- Reference angle?
- Which quadrants?
- Any co-terminal angles acceptable?

- If the domain is in degrees, give solutions in degrees.
- If the domain is in radians, give solutions in radians.

$\sin\theta = 0.9659$ use positive for $\bar{\theta}$ where is $\sin\theta > 0$ (positive)

$\bar{\theta} = \sin^{-1}(0.9659)$

$\bar{\theta} = 75°$

Q1	Q2
$\theta = \bar{\theta}$	$\theta = 180° - \bar{\theta}$
$\theta = 75°$	$\theta = 180° - 75° = 105°$
$\theta = 75° - 360° = -285°$	$\theta = 105° - 360° = -255°$
$\theta = 75° + 360° = 435°$	$\theta = 105° + 360° = 465°$

Solve: $\sec\theta = \frac{-1.3054}{1}$, $-2\pi \le \theta \le 2\pi$ (Radians) -6.28 6.28 (Approx. Value)

$\cos\theta = \frac{1}{-1.3054}$ where is cos < 0 (negative)

$\cos\theta = -0.7660$

$\bar{\theta} = \cos^{-1}(0.7660)$ use positive for $\bar{\theta}$

$\bar{\theta} = 0.7$ rads.

Q2	Q3
$\theta = \pi - \bar{\theta}$	$\theta = \pi + \bar{\theta}$
$\theta = 3.14 - 0.7 = 2.44$	$\theta = 3.14 + 0.7 = 3.84$
$\theta = 2.44 - 6.28 = -3.84$	$\theta = 3.84 - 6.28 = -2.44$

Exact Value

Ex. $\sqrt{2}\cos\theta + 1 = 0, \; -360° \le \theta \le 720°$ (Degrees)

$\frac{\sqrt{2}\cos\theta}{\sqrt{2}} = \frac{-1}{\sqrt{2}}$

$\cos\theta = \frac{-1}{\sqrt{2}}$ where is $\cos < 0$ (negative)

use positive for $\bar{\theta}$

$\bar{\theta} = \cos^{-1}\left(\frac{1}{\sqrt{2}}\right)$

$\bar{\theta} = 45°$

Q2	Q3
$\theta = 180° - \bar{\theta}$	$\theta = 180° + \bar{\theta}$
$\theta = 180° - 45° = 135°$	$\theta = 180° + 45° = 225°$
$\theta = 135° - 360° = -225°$	$\theta = 225° - 360° = -135°$
$\theta = 135° + 360° = 495°$	$\theta = 225° + 360° = 585°$

Ex. $\sin x + 1 = 0, \; -2\pi \leq x \leq 4\pi$

Let's move onto QUADRATIC trigonometric equations...

...Pre-Calculus 110

- What strategies can we use to solve quadratic equations?
- Quadratic trigonometric equations will ultimately become TWO linear trigonometric equations.

Solve: $2x^2 + x = 1$

Solve: $2\sin^2 x + \sin x = 1, \quad 0 \le x \le 4\pi$

Ex. $\cos^2\theta - \frac{1}{2}\cos\theta = 0, -2\pi \le \theta \le 4\pi$

Ex. $6\sin^2 x - \sin x = 2, -2\pi \leq \theta \leq 4\pi$

Your Turn
