

- Think of a number (1 or 2 digits)
- Double it
- Add 8
- Divide by 2 to get a new number
- Subtract the number you started with from the new number.
- Find the letter that corresponds in the alphabet.  
(A = 1, B = 2, C = 3, etc.)
- Think of a country beginning with that letter.
- Take the second letter of the name of that country, and think of an animal starting with that letter.
- Think of the color of that animal.

*Was it a gray elephant in Denmark?*

Let's try another . . . .

- Choose a number
- Add 5
- Double the result
- Subtract 4
- Divide the result by 2
- Subtract the number you started with

3

Algebra can explain these tricks:

- Choose a number  $x$
- Add 5  $x + 5$
- Double the result  $2(x + 5)$
- Subtract 4  $2x + 10 - 4$
- Divide the result by 2  $2x + 6$
- Subtract the number you started with  $x + 3$
- Subtract the number you started with  $x + 3 - x$

To solve equations you must do the opposite!!

1.  $x + 3 = 7$

*(Handwritten: The number 3 is circled in blue, and a blue arrow points from it to the right, indicating subtraction.)*

$$x = 4$$

$x = \frac{21}{7}$

*(Handwritten: The equation is crossed out with a red line. A red box is drawn over the original equation.)*

$$x = 3$$

3.  $x - 11 = 20$   $+11$

$$x = 31$$

4.  $5x = 25$   $+4$

$$\frac{5x}{5} = \frac{25}{5}$$

$$x = 5$$

5.

$$4x - 11 = 21 \quad +11$$

*Yes I can!!*

$$\frac{4x}{4} = \frac{32}{4}$$

$$x = 8$$

6.

$$5x - 20 = 35 \quad +20$$

*Bring it on!!*

$$\frac{5x}{5} = \frac{55}{5}$$

$$x = 11$$

*STOP!*  
*Try a few first!*

4.  $\frac{x}{3} = 11 \times 3$

$\frac{3x}{3}$

$x = 33$

5.

$x = 6.1$

5.

$$10 = -3x - (-11)$$

$$-3x - (-11) = 10$$

$$-3x + 11 = 10 - 11$$

$$\frac{-3x}{-3} = \frac{-1}{-3}$$

$$x = +\frac{1}{3}$$

6.  $-7g - (-3) = -4$

$-7g + 3 = -4 - 3$

$\begin{array}{l} \xrightarrow{+} \\ \xrightarrow{+} \\ \xrightarrow{+} \end{array} -7g = \frac{-7}{-7}$

$g = +1$

7.

$$-7y - 20 = -34$$

8.

$$2x - 5 = 15$$

9.

$$\frac{x^{\cancel{3}}}{\cancel{3}} + 4^{\cancel{3}} = 9^{\cancel{3}}$$

$$x + 12 = 27$$

$$x = 15$$

10.

$$\frac{2x^{\cancel{5}}}{\cancel{5}} + 1^{\times 5} = 9^{\times 5}$$

$$2x(+5) = 45 - 5$$

$$\frac{2x}{2} = \frac{40}{2}$$

$$x = 20$$
