### Questions from Homework

$$\frac{(-1)(4+0)}{(4+2)} = \frac{(-1)(4+0)}{(4+2)}$$

$$\lim_{X \to 0} \frac{(-1)(4+0)}{(4+2)} = \frac{(-1)(4+0)}{(4+2)}$$

# Questions from Homework

$$\lim_{x \to 0} \frac{(x+4)^3 - 64}{x} = \frac{\lambda_{1}ff}{4 \cdot cubes} (a^3 - b^3)$$

$$\lim_{x \to 0} \frac{(x+4)^3 - 64}{x} = \frac{\lambda_{1}ff}{(x+4)^3 + 4(x+4) + 16}$$

$$\lim_{x \to 0} \frac{(x+4)^3 - 64}{x} = \frac{\lambda_{1}ff}{(x+4)^3 + 4(x+4) + 16} = \frac{\lambda_{1}ff}{(x+4)^3 + 4(x+4)^3 + 16} = \frac{\lambda_{1}ff}{(x+4)^3 +$$

## **Limits at Infinity**

What exactly is infinity?

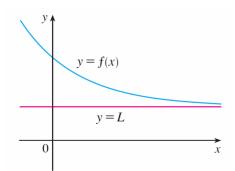

• It is the *process* of making a value arbitrarily large or small

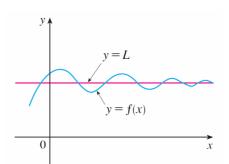

— \infty — Negative Infinity...process of becoming arbitrarily small

**4 Definition** Let f be a function defined on some interval  $(a, \infty)$ . Then

 $\lim_{x \to \infty} f(x) = L$ 

means that the values of f(x) can be made as close to L as we like by taking x sufficiently large.

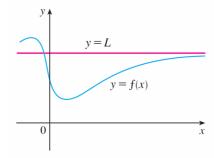

FIGURE 9

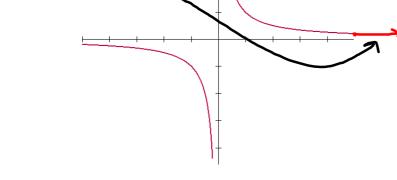

Examples illustrating  $\lim f(x) = L$ 

Have a look at these limits...

$$\lim_{x\to\infty}\frac{1}{x}=\mathbf{O}$$

$$\lim_{x\to\infty}\frac{1}{x}=O$$

As x gets larger y gets closer and closer to O"

In general...

If n is a positive integer, then

$$\lim_{x\to\infty}\frac{1}{x^n}=0$$

$$\lim_{x \to \infty} \frac{1}{x^n} = 0 \qquad \lim_{x \to -\infty} \frac{1}{x^n} = 0$$

#### Calculating limits at infinity without using a graph

#### Rational Functions

Note: If every term in a rational expression is divided by the same value, the rational expression will still be equal to it's original value

$$\frac{12+8}{6-2} = \frac{20}{4} = \frac{5}{4} = \frac{10}{4} = \frac{10}{3} = \frac{5}{3}$$
Divide the numerator and denominator by 2  $\frac{6+4}{3-1} = \frac{10}{3} = \frac{5}{3}$ 

This will be important when evaluating limits for rational functions approaching infinity...

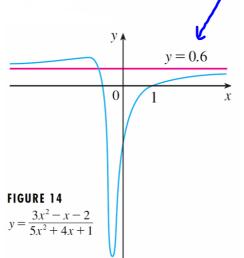

Look at the following example:

Look at the following example:

$$\lim_{x \to \infty} \frac{3x^2 - x - 2}{5x^2 + 4x + 1} = \lim_{x \to \infty} \frac{3x^2 - x - 2}{5x^2 + 4x + 1} = \lim_{x \to \infty} \frac{3 - \frac{1}{x} - \frac{2}{x^2}}{5 + \frac{4}{x} + \frac{1}{x^2}}$$
The degree of the numerator or denominator of the rational expression once they are expanded

$$= \frac{3}{5}$$
The for limits at infinity compare the degree of the numerator with the degree of the d

This graph below validates our solution:

= 0.6

#### Remember

If the highest degree is in the denominator then the *Limit* will be equal to 0

$$\lim_{N\to\infty} \frac{x^3+8}{x^3+6x+8} = 0$$

If the highest degree is in the numerator then the *Limit* will not exist.

$$\frac{x\to\infty}{1-3x_4} = DNE$$

If the degree is the same in the numerator and denominator then the *Limit* will be equal to the coefficients in front of the highest degree.

$$\lim_{x\to\infty}\frac{1-3x+3x^3}{(x+4)(x-3)}$$

$$\lim_{x \to \infty} \frac{1 - 9x + 3x_9}{1 - 9x + 3x_9} = \frac{3}{1}$$

Evaluate the following limit:

$$\lim_{n\to\infty}\frac{n^2-n}{2n^2+1}=\frac{1}{\partial}$$

$$\lim_{n\to\infty}\frac{1-n^5}{1+2n^5} = \frac{1}{2}$$

$$\lim_{n\to\infty} 4n' = DNE$$

$$\lim_{x \to \infty} \frac{-3(x^2 - 4)^2}{3 - 5x^2} = DNE$$

$$\lim_{x\to\infty} \frac{-3(x^4-8x^3+16)}{3-5x^3}$$

$$\frac{1m}{x \to \infty} = \frac{3x^4 + 34x^3 - 48}{3 - 5x^3} = ME$$
