

Exploring Continuity

③ a) what is the domain of f

$$f(x) = \begin{cases} x+2 & -\infty < x < \underline{-1} \\ 1 & \underline{-1} < x < 0 \\ 2x & x \geq 0 \end{cases}$$

$$D: \{x \mid x \neq \underline{-1}, x \in \mathbb{R}\}$$

$$\begin{array}{l|l} \text{b) } f(-1) = \text{undefined} & \lim_{x \rightarrow \underline{-1}^-} x+2 \\ & = -1 + 2 \\ & = 1 \\ & \lim_{x \rightarrow \underline{-1}^+} 1 \\ & = 1 \end{array}$$

Discontinuous @ $x = -1$

$$\lim_{x \rightarrow -1} f(x) \neq f(-1) \quad \text{removable discontinuity}$$

$$\begin{array}{l|l} \text{c) } f(0) = 2(0) \\ f(0) = 0 & \lim_{x \rightarrow \underline{0}^-} 1 \\ & = 1 \\ & \lim_{x \rightarrow \underline{0}^+} 2x \\ & = 2(0) \\ & = 0 \end{array}$$

Discontinuous @ $x = 0$

$$\lim_{x \rightarrow 0} f(x) \text{ does not exist or } \lim_{x \rightarrow 0^-} f(x) \neq \lim_{x \rightarrow 0^+} f(x)$$

jump discontinuity

Limits at Infinity

What exactly is infinity?

- It is the *process* of making a value arbitrarily large or small

$+\infty$ \longrightarrow Positive Infinity...process of becoming arbitrarily large

$-\infty$ \longrightarrow Negative Infinity...process of becoming arbitrarily small

4 Definition Let f be a function defined on some interval (a, ∞) . Then

$$\lim_{x \rightarrow \infty} f(x) = L$$

means that the values of $f(x)$ can be made as close to L as we like by taking x sufficiently large.

FIGURE 9
Examples illustrating $\lim_{x \rightarrow \infty} f(x) = L$

Have a look at these limits...

HA

$$\lim_{x \rightarrow \infty} \frac{1}{x} = 0$$

$$\lim_{x \rightarrow -\infty} \frac{1}{x} = 0$$

$$f(x) = \frac{1}{x}$$

vertical asymptote @ $x=0$

$$\lim_{x \rightarrow 0^-} f(x) = -\infty$$

$$D: \{x \mid x \neq 0, x \in \mathbb{R}\}$$

$$\lim_{x \rightarrow 0^+} f(x) = +\infty$$

Horizontal Asymptote $y=0$

In general...

7 If n is a positive integer, then

$$\lim_{x \rightarrow \infty} \frac{1}{x^n} = 0$$

$$\lim_{x \rightarrow -\infty} \frac{1}{x^n} = 0$$

Calculating limits at infinity without using a graph

• Rational Functions

Note: If every term in a rational expression is divided by the same value, the rational expression will still be equal to its original value

$$\frac{12+8}{6-2}$$

Divide the numerator and denominator by 2 →

This will be important when evaluating limits for rational functions approaching infinity...

Look at the following example:

$$\lim_{x \rightarrow \infty} \frac{3x^2 - x - 2}{5x^2 + 4x + 1} = \lim_{x \rightarrow \infty} \frac{3x^2 - x - 2}{x^2} = \lim_{x \rightarrow \infty} \frac{3 - \frac{1}{x} - \frac{2}{x^2}}{5 + \frac{4}{x} + \frac{1}{x^2}}$$

approach 0

Divide every term by the **HIGHEST power that is present in denominator of the rational expression once they are expanded**

$$= \frac{3 - 0 - 0}{5 + 0 + 0}$$

$$= \frac{3}{5}$$

This graph below validates our solution:

- Remember

If the highest degree is in the denominator then the *Limit* will be equal to 0

If the highest degree is in the numerator then the *Limit* will not exist. Determine if it's $\pm\infty$

If the degree is the same in the numerator and denominator then the *Limit* will be equal to the coefficients in front of the highest degree. (Quotient of leading coefficients)

Evaluate the following limit:

$$\lim_{n \rightarrow \infty} \frac{n^2 - n}{2n^2 + 1}$$

$$= \frac{1}{2}$$

$$\lim_{n \rightarrow \infty} \frac{n^2 - n}{2n^2 + 1} = \lim_{n \rightarrow \infty} \frac{\frac{n^2 - n}{n^2}}{\frac{2n^2 + 1}{n^2}}$$

$$= \lim_{n \rightarrow \infty} \frac{1 - \frac{1}{n}}{2 + \frac{1}{n^2}}$$

$$= \frac{1 - 0}{2 + 0} = \frac{1}{2}$$

$$\lim_{n \rightarrow \infty} \frac{1 - n^5}{1 + 2n^5}$$

$$= \frac{-1}{2}$$

$$\lim_{n \rightarrow \infty} 4n = +\infty$$

$$\lim_{n \rightarrow \infty} 4n = -\infty$$

$$\lim_{x \rightarrow \infty} -4x = -\infty$$

$$\lim_{x \rightarrow -\infty} -4x = +\infty$$

$$\lim_{x \rightarrow \infty} \frac{-3(x^2 - 4)^2}{3 - 5x^2}$$

$$= \lim_{x \rightarrow \infty} \frac{-3(x^4 - 8x^2 + 16)}{3 - 5x^2}$$

$$= \lim_{x \rightarrow \infty} \frac{-3x^4 + 24x^2 - 48}{3 - 5x^2}$$

$$= \lim_{x \rightarrow \infty} \frac{\frac{-3x^4 + 24x^2 - 48}{x^2}}{\frac{3 - 5x^2}{x^2}}$$

$$= \lim_{x \rightarrow \infty} \frac{-3x^2 + 24 - \frac{48}{x^2}}{\frac{3}{x^2} - 5}$$

← approaching 0

$$= \frac{-3x^2 + 24 - 0}{0 - 5}$$

$$= \frac{-3x^2 + 24}{-5}$$

← A huge negative

$$= +\infty$$

← negative divided by negative

Questions from Homework

$$\textcircled{5} \text{ b) } \lim_{x \rightarrow -\infty} \frac{x^5 - x^2}{\underline{x^3} - 2x}$$

$$= \lim_{x \rightarrow -\infty} \frac{\frac{x^5}{x^3} - \frac{x^2}{x^3}}{\frac{x^3}{x^3} - \frac{2x}{x^3}}$$

$$= \lim_{x \rightarrow -\infty} \frac{x^2 - \frac{1}{x}}{1 - \frac{2}{x^2}}$$

Approaching 0

$$= \lim_{x \rightarrow -\infty} \frac{x^2}{1}$$

when square a negative you get a positive

$$= +\infty$$

Questions from Homework

$$\textcircled{5} \text{ f) } \lim_{x \rightarrow \infty} \left(\frac{1}{8}\right)^x + \frac{x^3 - 4x^2 - 5x}{4x^3 + 3x} - 7$$

$$= \underbrace{\lim_{x \rightarrow \infty} \left(\frac{1}{8}\right)^x}_{\text{red}} + \underbrace{\lim_{x \rightarrow \infty} \frac{x^3 - 4x^2 - 5x}{4x^3 + 3x}}_{\text{blue}} - \underbrace{\lim_{x \rightarrow \infty} 7}_{\text{green}}$$

$$= 0 + \frac{1}{4} - 7$$

$$= \frac{1}{4} - \frac{28}{4}$$

$$= \frac{-27}{4}$$

$$\textcircled{g} \lim_{x \rightarrow \infty} \left(\frac{7}{3}\right)^{-x} + \frac{4x^2 - 5x}{2x^2 + 1} - 9$$

$$= \underbrace{\lim_{x \rightarrow \infty} \left(\frac{3}{7}\right)^x}_{\text{red}} + \underbrace{\lim_{x \rightarrow \infty} \frac{4x^2 - 5x}{2x^2 + 1}}_{\text{blue}} - \underbrace{\lim_{x \rightarrow \infty} 9}_{\text{green}}$$

$$= 0 + 2 - 9$$

$$= -7$$

Try These ones on your own!

by definition: $\underline{\sqrt{x^2}} = \underline{|x|} = \begin{cases} |x| & x < 0 \\ x & x \geq 0 \end{cases}$

Indeterminate $\frac{\infty}{\infty}$ $\frac{-\infty}{\infty}$ Rationalizing does not work

$$\lim_{x \rightarrow \infty} \frac{4x+3}{\sqrt{4x^2+9}}$$

$$= \lim_{x \rightarrow \infty} \frac{x(4+\frac{3}{x})}{\sqrt{x^2(4+\frac{9}{x^2})}}$$

$$= \lim_{x \rightarrow \infty} \frac{x(4+\frac{3}{x})}{|x|\sqrt{4+\frac{9}{x^2}}}$$

x values are getting infinitely large (+)

$$= \lim_{x \rightarrow \infty} \frac{4+\frac{3}{x}}{\sqrt{4+\frac{9}{x^2}}}$$

approach 0

$$= \frac{4+0}{\sqrt{4+0}}$$

$$= \frac{4}{2}$$

$$= 2$$

$$\lim_{x \rightarrow -\infty} \frac{4x+3}{\sqrt{4x^2+9}}$$

$$= \lim_{x \rightarrow -\infty} \frac{x(4+\frac{3}{x})}{\sqrt{x^2(4+\frac{9}{x^2})}}$$

$$= \lim_{x \rightarrow -\infty} \frac{-1 x(4+\frac{3}{x})}{|x|\sqrt{4+\frac{9}{x^2}}}$$

x values are getting infinitely small (-)

$$= \lim_{x \rightarrow -\infty} \frac{-(4+\frac{3}{x})}{\sqrt{4+\frac{9}{x^2}}}$$

approach 0

$$= \frac{-(4+0)}{\sqrt{4+0}}$$

$$= \frac{-4}{2}$$

$$= -2$$

What about the following limits:

$$\lim_{x \rightarrow -\infty} \frac{\sqrt{x+16x^2}}{x+1} = -4$$

$$\lim_{x \rightarrow \infty} \frac{\sqrt{x+16x^2}}{x+1} = 4$$
