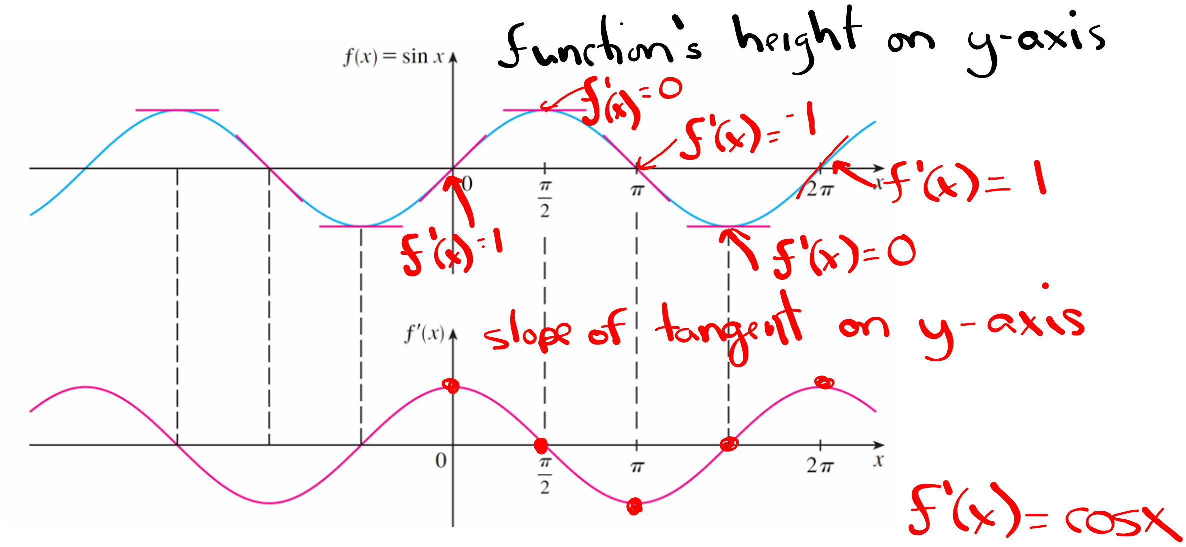
Derivatives of Trigonometric Functions

The Sine Function

- We recall that the derivative $f'(x)$ of a function $f(x)$ gives the slope of the tangent.
- On the next slide we graph $f(x) = \sin x$ together with $f'(x)$, as determined by the slope of the tangent to the sine curve.
  - Note that x is measured in radians.
- The derivative graph resembles the graph of the cosine!



$f'(x)$

x	$f'(x)$
0	1
$\pi/2$	0
π	-1
$3\pi/2$	0
2π	1

Let's check this using the definition of a derivative...

$$f'(x) = \lim_{h\to 0}\frac{f(x+h)-f(x)}{h} = \lim_{h\to 0}\frac{\sin(x+h)-\sin x}{h}$$

$$= \lim_{h\to 0}\frac{\sin x\,\cos h + \cos x\,\sin h - \sin x}{h}$$

$$= \lim_{h\to 0}\left[\frac{\sin x\,\cos h - \sin x}{h} + \frac{\cos x\,\sin h}{h}\right]$$

$$= \lim_{h\to 0}\left[\frac{\sin x\,\cos h - \sin x}{h} + \frac{\cos x\,\sin h}{h}\right]$$

$$= \lim_{h\to 0}\left[\sin x\left(\frac{\cos h - 1}{h}\right) + \cos x\left(\frac{\sin h}{h}\right)\right]$$

$$= \lim_{h\to 0}\sin x \cdot \lim_{h\to 0}\frac{\cos h - 1}{h} + \lim_{h\to 0}\cos x \cdot \lim_{h\to 0}\frac{\sin h}{h}$$

- Our calculations have brought us to four limits, two of which are easy:
  - Since x is constant while $h \to 0$,

$$\lim_{h\to 0}\sin x = \sin x \quad\text{and}\quad \lim_{h\to 0}\cos x = \cos x$$

- With some work we can also show that

$$\lim_{h\to 0}\frac{\sin h}{h} = 1 \quad\text{and}\quad \lim_{h\to 0}\frac{\cos h - 1}{h} = 0$$

- Thus our guess is confirmed:

$$f'(x) = \lim_{h\to 0}\sin x \cdot \lim_{h\to 0}\frac{\cos h - 1}{h} + \lim_{h\to 0}\cos x \cdot \lim_{h\to 0}\frac{\sin h}{h}$$

$$= (\sin x)\cdot 0 + (\cos x)\cdot 1 = \cos x$$

Rules to differentiate trigonometric functions:

$y = \sin x$

$u = x$

$du = 1$

$\frac{dy}{dx} = \cos x \cdot 1$

Given that "u" represents some differentiable function...

$\frac{dy}{dx} = \cos x$

$$\frac{d}{du}(\sin u) = \cos u \bullet du$$

$$\frac{d}{du}(\csc u) = -\csc u \cot u \bullet du$$

$$\frac{d}{du}(\cos u) = -\sin u \bullet du$$

$$\frac{d}{du}(\sec u) = \sec u \tan u \bullet du$$

$$\frac{d}{du}(\tan u) = \sec^2 u \bullet du$$

$$\frac{d}{du}(\cot u) = -\csc^2 u \bullet du$$

Let's Practice...

Differentiate the following:

$y = \sin 3x$

$u = 3x$

$du = 3$

$y' = \cos u \cdot du$

$y' = \cos(3x) \cdot 3$

$\boxed{y' = 3\cos(3x)}$

$y = \sin(x+2)$

$u = x + 2$

$du = 1$

$\boxed{y' = \cos(x+2)}$

$y = \sin(kx+d)$

$u = kx + d$

$du = k$

$\boxed{\frac{dy}{dx} = k\cos(kx+d)}$

Ex #2.

Differentiate:

a) $y = \sin(x^3)$

$u = x^3$

$du = 3x^2$

$y' = \cos(x^3) \cdot 3x^2$

$\boxed{y' = 3x^2 \cos(x^3)}$

$u = x$

$du = 1$

$y = (\sin x)^3$

b) $y = \sin^3 x$

$\frac{dy}{dx} = 3(\sin x)^2 (\cos x \cdot 1)$

$\boxed{\frac{dy}{dx} = 3\sin^2 x \cos x}$

c) $y = \sin^3(x^2 - 1)$

$y = [\sin(x^2-1)]^3$

$u = x^2 - 1$

$du = 2x$

$y' = 3[\sin(x^2-1)]^2 \cdot \cos(x^2-1) \cdot 2x$

$\boxed{y' = 6x \sin^2(x^2-1)\cos(x^2-1)}$

Ex #3.

Differentiate:

$$y = (x^2)(\cos x)$$

Product Rule

$u = x$
$du = 1$

$$\frac{dy}{dx} = 2x\cos x + x^2(-\sin x)(1)$$

$$\frac{dy}{dx} = 2x\cos x - x^2\sin x$$

$$\boxed{\frac{dy}{dx} = x(2\cos x - x\sin x)}$$
